 COMPLEMENT ACTIVATION 7, 5

J. MOI. BIOI. 272:253-265(1997).

-: FUNCTION: SERVES TO PROTECT THE VIRUS AGAINST COMPLEMENT ATTACK BY INHIBITING BOTH CLASSICAL AND ALTERNATIVE PATHWAYS OF COMPLEMENT ACTIVATION. BINDS C3B AND C4B.

-: SIMILARITY: BELONGS TO THE SUPERFAMILY OF THE REGULATORS OF COMPLEMENT ACTIVATION (BCA).

-!- SIMILARITY: CONTAINS 4 SUSHI (SCR) REPEATS.
                                                                                                                                                                                                              "Vaccinia virus complement-control protein prevents antibody-dependent complement-enhanced neutralization and contributes to virulence.";

                                                                                                                                                                                               "Molecular cloning of the b subunit of mouse coagulation factor XIII and assignment of themsene to chromosome 1: close evolutionary relationship to complement factor H.";

Genomics 15:335-42(1993).

-i- FUNCTION: THE B CHAIN OF FACTOR XIII IS NOT CATALLYTICALLY ACTIVE, BUT IS THOUGHT TO STABILIZE THE A SUBUNITS AND REGULATE THE RATE OF TRANSGLUTAMINASE FORMATION BY THROWBIN.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND TWO B CHAINS.
-i- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN LIVER AND KIDNEY.

TEUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DESCRIPTION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DESCRIPTION THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH SERUM AMYLOID P COMPONENT.

                                               FUNCTION: CA(2+) DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS TO CARROHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALYL-LEWIS X. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: STORED IN THE ALPHA-GRANULES OF PLATELETS AND WELLBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL ACTIVATION BY AGONISTS, P-SELECTIN IS TRANSPORTED RAPIDLY TO
     INDUCTION: BY TUMOR NECROSIS FACTOR ALPHA

"Two genetic defects in a patient with complete deficiency of the b-
subunit for coagulation factor XIII.";
Blood 82:145-150(1993).

-i- FUNCTION: THE B CHAIN OF FACTOR XIII IS NOT CATALYTICALLY ACTIVE,
BUT IS THOUGHT TO STABILIZE THE A SUBUNITS AND REGULATE THE RATE
OF TRANSGLUTAMINASE FORMATION BY THROMBIN.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND TWO B CHAINS.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND HABITUAL ABORTION.

-I- SIMILARITY: CONTAINS 10 SUBHI (SCR) REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic [5]

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Thu Jun 8 21:49:10 2000; MasPar time 13.73 Seconds 738.315 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: >US-09-316-163-14 (1-428) from US09316163.pep 3371

Sequence: 1 EDCKGPPPRENSEILSGSWS......DTYYCTENGWSPPPKCVRIK 428

Scoring table:

PAM 150 Gap 11

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0%/ Listing/first 45 summaries Database: a-geneseq36 1:geneseqp

Mean 34.511; Variance 134.258; scale 0.257

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This partial protein is found in clone pRRB9FH410 and represents a complement factor H related protein with homology to a region of the human tumour-associated complement factor H (CFH). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.

                                                                                                                                                                                                                                                                                                                                                              Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                 short consensus repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA encodes a protein having homology to human complement factor H, which plays a role in the immunological mechanism involving the complement reaction. The protein can also be used as an antigen for preparing antibodies against the protein. The count can be used as a probe for gene diagnosis and the gene for gene therapy, as well as for large-scale expression of the protein. The protein may also have immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, anti-inflammatory activity, tumour inhibition activity, chemotactic/chemokinetic activity receptor/ligand activity, etc. The protein is identified by the presence of a hydrophobic N-terminal secretory signal region, knowledge of the protein function is not required, as in e.g. methods of expression
                                                                                                                                                                    region
                                                                                                                                                                                                                                                                                                      peptide

This sequence was deduced from human hepatocyte (Hep G2) cDNA obtained following PCR amplification. The protein is a monomer containing 8 SCRs. Each SCR forms a looped domain due to the presence of two intradomain disulphide bonds (only the disulphide bonds of SCR8 are labelled in the Features Table). Within each SCR, the first cysteine residue bonds with the third and the second cysteine residue bonds with the third and the second cysteine residue bonds with the fourth. This secondary structure is responsible for the conformational flexibility of the C4bp monomer. The invention covers fusion proteins in which the monomer sequence, or a specified subfragment of it, e.g. having 5, 4, 3 or 1 SCR(s) is fused to the C-terminal of a protein such as a viral receptor, coutoffice the contain and contains the immunogen, enzyme,

                                                                                                                                                                                                                                                                                                  The cDNA clone designated CRI-4 was described in J.Exp.Med.(1988) 168:1255-1270. It encodes the first 8 and a half amino terminal SCRs of CRI. The invention concerns analogues of "regulator of complement activation" proteins or truncated, hybrid or recombinant forms of them. CRI-4 is a preferred truncated form and a number of specified substitution variants of it are claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CRI-4 sequence; the sequence given here was constructed from the full-length CRI amino acid sequence having GENESEQ accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CR1-4 (99H, 103E) analogue.
short consensus repeat; regulator of complement activation;
C3b binding; C4b binding; human complement type 1 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R28557 standard; peptide; R28557;

The specification does not contain the CRI-4 sequence; the sequence given here was constructed from the full-length CRI amino acid sequence having GENESEQ accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for diagnosis etc.

Claim II; Fig 2 and R11810; 23pp; English.

The CDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

168:1255-1270. It encodes the first 8 and a half amino terminal

SCRs of CR1. The invention concerns analogues of "regulator of

complement activation" proteins or truncated, hybrid or recombinant

forms of them. CR1-4 is a preferred truncated form and a number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

It is used to inhibit a T-cell or B-cell-mediated immune response to prevent immune response-mediated tissue rejection and destruction or clearance or inactivation of an expressed protein especially from cells that have been treated by get
                                                                                                                                                                                                                                                                                                                                                                                                                                                   an interferon gamma secretory response, autoimmune response or neurological response, e.g. Alzheimer's or Parkinson's disease or multiple sclerosis. Also the protein can be used to treat systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amino acid sequence of the soluble complement receptor 1 (sCR1). Human; soluble complement receptor 1; sCR1; T-cell; B-cell; mediated immune response; inhibition; tissue rejection; gene therapy; dystrophin; inflammatory response; interferon-gamma secretory response; autoimmune response; neurological response; Alzheimer's disease; parkinson's disease; multiple sclerosis; systemic lupus erythematosus; remainded arthritis; myasthenia gravis; epidermis bullosa;
                                                                                                                                                                                                                                                                                                                                                                                                                    epidermis bullosa or Hashimoto's disease. MBE interact, independently and with thermodynamic additivity, with components of cellular or artificial membranes exposed to extracellular fluids. (A) are used to treat disorders treatable with (I) itself, specifically inflammation or any other complement-related disorder (e.g. neurological disease, graft rejection, myocardial infarction, sepsis, rheumatoid arthritis and many others; including application to indwelling devices) and thrombolytic disease, but also to treat allergy, induce weight loss, to treat ischaemia or asthma and as immuno-modulators for treating multiple sclerosis. (A) are administered orally, topically, by injection or inhalation at 0.01-10 (preferably 0.1-10) moderniary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human complement receptor 1 (residues 1-1929).

Membrane binding element; thrombotic disease; soluble protein; complement-related disease; integral membrane protein; inflammation; short consensus repeat; SCR 1-3; CR1; complement receptor type 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-JAN-1998.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P92219 standard; protein; 2317
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the transmembrane region. The proteins and fragments bind C3b and/or C4b, have cofactor activity and inhibit C3 and C5 convertase activity. In the sequence, x=untranslated region. This has 7 short consensus repeats (CR) of 4 long direct homologous repeats (CR) (See fig. 10 in patent). Deletion mutants, eg LHR-A for binding of C4b, and LHR-C for C3b binding, be made, and LHR-B and C can detect CR2 sequences. They are useful in diagnosing and treating immune disorders, and preven
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-PSDB; N91477

CC The CDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

CC 168:1255-1270. It encodes the first 8 and a half amino terminal

CC SCRs of CR1. The invention concerns analogues of "regulator of

CC complement activation" proteins or truncated, hybrid or recombinant

CC complement of them. CR1-4 is a preferred truncated form and a number of

CC specified substitution variants of it are claimed in which certain

CC specified substitution variants of it are claimed in which certain

CC specified of 3bb- and C4b-binding are substituted by amino acids from

CC degree of C3b- and C4b-binding are substituted by amino acids from

CC contain the CR1-4 sequence; the sequence given here was constructed

CC contain the CR1-4 sequence; the sequence having GENESEO

CC accession number R11810 and descriptions in the disclosure.

Chaim 16; Fig 2 and R11810; CR1-4 was described in J.Exp.Med.(1988)

Consider the invention concerns analogues of "regulator of complement activation" proteins or truncated, hybrid or recombinant forms of them. CR1-4 is a preferred truncated form and a number of complement etc. A specified substitution variants of it are claimed in which certain consistent in SCR-2 which have been identified as important for the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed accession number R11810 and descriptions in the disclosure.

Example 8; Page 18 and Ril810; 23pp; English.

168:1255-1270. It encodes the first 8 and a half amino terminal conservation of the first 8 and a half amino terminal complement activation proteins or truncated, hybrid or recombinant complement activation variants of it are disclosed in which certain specified substitution variants of it are disclosed in which certain specified substitution variants of it are disclosed in which certain specified substituted by amino acids from the corresponding positions in SCR5 which are involved in C3b-and the corresponding positions in SCRs which are involved in C3b-binding. The substitution variant given here has increased C3b-binding. The specification does not contain the CR1-4 sequence; the sequence given here was constructed from the full-length CR1 amino acid sequence having GENESEQ accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-MAR-1993 (first entry)
CR1-4 (364-367 NAAH) analogue.
cR1-4 (364-367 NAAH) analogue of complement activation;
short consensus repeat; regulator of complement type 1 receptor.
C3b binding; C4b binding; human complement type 1 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

Claim 12; Fig 2 and R11810; 23pp; English.

Claim 11; Fig 2 and R11810; 23pp; English.

Claim 11; Fig 2 and R11810; 23pp; English.

Claim 12; Fig 2 and R11810; 23pp; English.

Claim 12; Fig 2 and R11810; 23pp; English.

Claim 14; Fig 2 and R11810; 23pp; English.

Claim 20; Fig 3 and All Fig 3 and All famino terminal complement activation; proteins or truncated, hybrid or recombinant complement activation; proteins or truncated form and a number of Complement activation variants of it are claimed in which certain compositions in SCR-2 which have been identified as important for the Complement of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

                                                                                        Human complement receptor type 1 gene, encoded proteins and fragments - for treatment of immune disorders, myocardial infarct, damage due to inflammantion and in treatment of thrombosis Disclosure; Fig 5; 234pp; English.

This sequence comprises three of the four tandem, direct, long homologous repeats of the full-length F allozyme of CRI. LHR-A is absent. Each LHR might represent a single C3b/C4b binding domain, making the receptor multivalent. The LHR's are composed of 7 short consensus repeats of 60-70 residues resembling the SCR's of other consensus repeats of 60-70 residues resembling the SCR's of other 23/C4 binding proteins. The protein and fragments of it having C3b and/or C4b binding activity can be used to treat immune disorders
